"Ardipithecus (Ardipithecus) vs. Australopithecus (Australopithecus) suggests that early hominids did not necessarily evolve in a linear fashion. Instead, they may have been influenced by a variety of factors, including environmental changes and social dynamics. This has led to a more complex understanding of early human evolution. Brooks Hanson 2010

Ardipithecus suggests that early hominids were not only the ancestors of modern humans, but also shared a common ancestor with early apes. This has important implications for our understanding of the evolution of human cognition and behavior. Brooks Hanson 2010

Ardipithecus was discovered in 2009 in Ethiopia and is one of the earliest known hominid species. This has prompted new research into the origins of human evolution. Brooks Hanson 2010

The American Association for the Advancement of Science (AAAS) and LANL today announced that 10:30 ET on June 29, 2014, AAAS will release a study examining the effects of specific environmental factors on human health. The study was conducted by AAAS and LANL scientists. The study results will be released on the LANL website at scipak@aaas.org.

Visit www.eurekalert.org for more information.
